Finding Time Complexity of Algorithms

2.a. Finding Complexity using Counter Method

Aim: Convert the following algorithm into a program and find its time complexity
using the counter method.

```
void function (int n)
{
    int i= 1;    int s =1;

    while(s <= n)
    {
        i++;
        s += i;
     }
}
```

Note: No need of counter increment for declarations and scanf() and count variable
printf() statements.

Input:
 A positive Integer n
Output:
Print the value of the counter variable

Algorithm:

void function(int

   n){ set count =

   0

   set i = 1

   increment count by 1

```
    set s = 1

    increment count by 1

    while (s <=n){

        increment count by

        1 increment i by 1

        increment count by

        1 set s = s + i

        increment count by

        1

    }

    increment count by

    1 print count

}
```

Program:

```c
#include<stdio.h>

void function(int
    n){ int count=0;
    int i=1;
    count++
    ; int s=1;
    count++
    ;
    while(s<=n){
        count++;
        i++;
        count++;
        s+=i;
```

```c
            count++;
        }
        count++;
        printf("%d",count);
    }
    int main(){
        int n;
        scanf("%d",&n);
        function(n);
    }
```

Output:

	Input	Expected	Got	
✔	9	12	12	✔
✔	4	9	9	✔

Passed all tests! ✔

2.b. Finding Complexity using Counter Method

Aim: Convert the following algorithm into a program and find its time complexity using the counter method.

```
void func(int n)
{
    if(n==1)
    {
      printf("*");
    }
    else
    {
     for(int i=1; i<=n; i++)
     {
       for(int j=1; j<=n; j++)
       {
          printf("*");
          printf("*");
          break;
       }
     }
   }
 }
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.
Input:
 A positive Integer n
Output:
Print the value of the counter variable

Algorithm:

void func(int n){

   initialize count to 0

  if n = 1{

    increment count by 1

    print "*"

  }

  else{

    increment count by 1

```
      // outer loop from 1 to n

    for each i from 1 to n{

       increment count by 1

       // inner loop from 1 to n

       for each j from 1 to n {

          increment count by 1

          // simulate print statements with count increments

          increment count by 1 // first simulated printf("*")

          increment count by 1 // second simulated printf("*")

          // exit inner loop immediately

          increment count by 1 // break

          statement

       }

       increment count by 1

    }

    increment count by 1

  }

   print count

}

Program:
#include<stdio.
h> void func(int
n)
{ int
   count=0;
   if(n==1)
   { count++;
```

```c
      printf("*");
    }
    else
    {count++;
     for(int i=1; i<=n; i++)
     { count++;
      for(int j=1; j<=n; j++)
      { count++;
         //printf("*")
         ; count++;
         //printf("*");
         count++;
         break;
       }
       count++;
      }
      count++;
    }
    printf("%d",count);
}

int main(){
    int n;
    scanf("%d",&n)
    ; func(n);
}
```

Output:

	Input	Expected	Got	
✔	2	12	12	✔
✔	1000	5002	5002	✔
✔	143	717	717	✔

2.c. Finding Complexity using Counter Method

Aim: Convert the following algorithm into a program and find its time complexity
using counter method.

```
 Factor(num) {
{
   for (i = 1; i <= num;++i)
   {
    if (num % i== 0)
      {
        printf("%d ", i);
      }
    }
  }
```

Note: No need of counter increment for declarations and scanf() and counter
variable printf() statement.

Input:
 A positive Integer n
Output:
Print the value of the counter variable

Algorithm:

function Factor(num) {

   initialize count to 0

   // loop from 1 to num

   for each i from 1 to num {

     increment count by 1

     // check if i is a factor of

     num if num modulo i equals

     0 {

       increment count by 1

       // simulate printing i (e.g., printf("%d ", i);)

     }

increment count by 1 // end of inner if-statement

    }

    increment count by 1 // after loop completion

    print count

}

Program:

```c
#include<stdio.h>
void Factor(int
num)
{ int count=0;
    for (int i = 1; i <= num;++i)
    {
        count++;
        if (num % i== 0)
        {
            count++;
            //printf("%d ", i);
        }
        count++;
    }
    count++;
    printf("%d",count);
}

int main(){
```

```
    int n;

    scanf("%d",&n);

    Factor(n);

}
```

Output:

	Input	Expected	Got	
✔	12	31	31	✔
✔	25	54	54	✔
✔	4	12	12	✔

2.d. Finding Complexity using Counter Method

Aim: Convert the following algorithm into a program and find its timecomplexity using counter method.

```
void function(int n)
{
    int c= 0;
    for(int i=n/2; i<n; i++)
        for(int j=1; j<n; j = 2 *
        j)
            for(int k=1; k<n; k = k * 2)
                c++;
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:
 A positive Integer n
Output:
Print the value of the counter variable

Algorithm:

function(n) {

    initialize count to 0

    initialize c to 0

    increment count by 1

    // outer loop: i goes from n/2 to n-1

    for each i from n/2 to n-1 {

      increment count by 1

      // middle loop: j starts at 1 and doubles each iteration until j < n

      for each j starting from 1 and doubling each time (j = 2 * j) until j < n {

        increment count by 1

// inner loop: k starts at 1 and doubles each iteration until k < n

for each k starting from 1 and doubling each time (k = k * 2) until k <

n { increment count by 1

increment c by 1

increment count by

1

}

increment count by 1 // after inner loop ends

}

increment count by 1 // after middle loop ends

}

increment count by 1 // after outer loop ends

print count

}

Program:

```
#include<stdio.h>
void function(int n)
{
    int
    count=0;
    int c= 0;
    count++;
    for(int i=n/2; i<n; i++){
        count++;
```

```c
        for(int j=1; j<n; j = 2 * j){
            count++;
            for(int k=1; k<n; k = k *
                2){ count++;
                c++;
                count++;
            }
            count++;
        }
        count++;
    }
    count++;
    printf("%d",count);
}
int main(){
    int n;
    scanf("%d",&n);
    function(n);
}
```

Output:

	Input	Expected	Got	
✔	4	30	30	✔
✔	10	212	212	✔

2.e. Finding Complexity using Counter Method

Aim: Convert the following algorithm into a program and find its time complexity using counter method.

```
void reverse(int n)
{
   int rev = 0, remainder;
   while (n != 0)
    {
        remainder = n % 10;
        rev = rev * 10 + remainder;
        n/= 10;

    }
print(rev);
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:
 A positive Integer n
Output:
Print the value of the counter variable

Algorithm:

function reverse(n) {

   initialize count to 0

   initialize rev to 0

   initialize remainder

   increment count by 1 // for initialization

   // loop until n is not equal to 0

   while n is not equal to 0 {

      increment count by 1 // start of loop

      remainder = n modulo 10

increment count by 1 // after calculating remainder

rev = rev * 10 + remainder

increment count by 1 // after updating rev

n = n divided by 10

increment count by 1 // after updating n

}

increment count by 1 // after loop ends

// simulate printing rev (e.g., print(rev))

increment count by 1 // for print statement

print count

}

Program:

```c
#include<stdio.h>
void reverse(int n)
{
  int count=0;
   int rev = 0,
  remainder; count++;
  while (n != 0)
  {
     count++;
     remainder = n % 10;
```

```c
        count++;

        rev = rev * 10 + remainder;

        count++;

        n/= 10;

        count++;

    }
    count++;
//print(rev);
count++;
printf("%d",coun
t);
}

int
    main(){
    int n;
    scanf("%d",&n);
    reverse(n);
}
```

Output:

	Input	Expected	Got	
✔	12	11	11	✔
✔	1234	19	19	✔
